

Parallel Processing Approach.

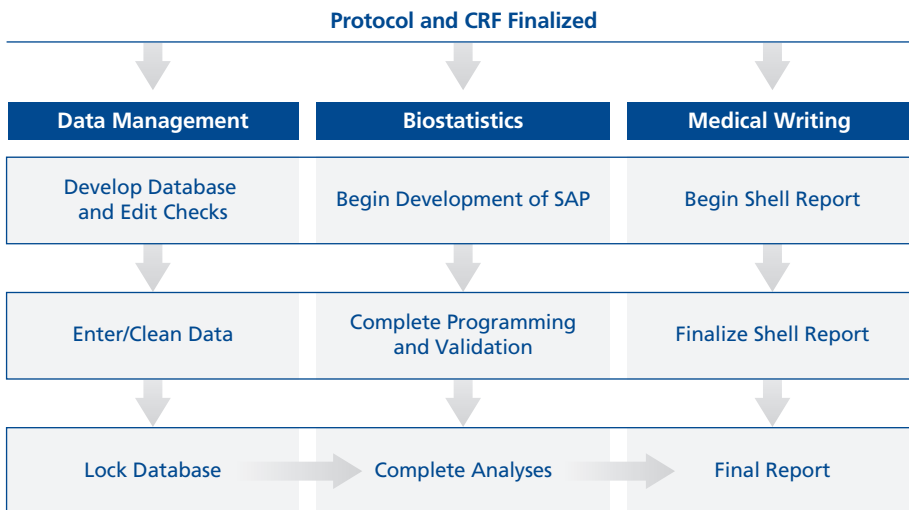

Premier Research's Parallel Processing Approach™ provides inherent efficiencies by leveraging the value of simultaneously performing data management, statistics, and medical writing activities.

Maximizing Efficiencies

The Parallel Processing Approach (PPA) successfully implements cost-effective high quality, rapid execution of biometrics study tasks. We have tested, refined, and perfected this approach on more than 300 projects. Utilizing PPA, each team initiates and processes its part of the project as quickly as possible. The timelines and deliverables are managed by a dedicated Biometrics Project Manager (BPM).

The BPM works with the department leads to ensure all the critical processes and procedures for data management, statistics, and medical writing are conducted simultaneously so by the time the final CRF is entered and validated, all the SAS programming and report and analysis formats have been completed and approved. The clinical study report can then be rapidly generated soon after database lock.

By implementing PPA, time can be afforded to extensive 'end-to-end' quality control procedures where all data and results of the study are examined.

Case Study: Meeting Aggressive Timelines

Premier Research has worked with a Top 5 Pharmaceutical Company over the past four years on more than 15 studies. The enrollment in the studies ranged from 200 subjects to more than 1,000 subjects. Premier Research performed the data management, biostatistics, and medical writing services.

Employing the PPA, all databases were locked within 20 working days of last patient last visit with topline results available to the sponsor within five days of database lock and draft clinical study report within 15 days from the final tables listings, and figures. This allowed the sponsor to meet internal performance metrics and present invaluable data to the patients and physicians using their products.
